TRAVERSING SYSTEM

SPECIALITY RANGE

OVERVIEW

Moovmor design and manufacture traversing systems for the waste recycling industry.

These will either take the form of detaching and interchanging the containers to and from a stationary compactor or the compactor itself will be designed to detach and travel up and down a line of stationary containers. This allows the waste recyclers and particular household recycling centre site operators to exchange full containers without the need to rely on a transport vehicle being available.
